

Business Sales Performance

Analysis Report · Microsoft Excel

Retail dataset analysis covering revenue, profit distribution, and the impact of discounts on profitability.

R2,295,274	R285,988	12.5%
Total Sales	Total Profit	Profit Margin

Discount impact on profit

Key findings

- Technology leads in both revenue and profit — the highest-performing category across both metrics.
- Furniture generates strong sales (R742,000) but only R18,451 in profit, indicating very thin margins.

Discounts above 30% consistently produce financial losses; 70-80% discounts reached -R40,075.

The business relies on moderate pricing strategies (0-20% discounts) to remain profitable.

Recommendations

Cap discounts at 20% to protect profit margins across all categories.

Prioritise marketing spend on Technology products due to their strong revenue and profit performance.

Review Furniture pricing strategy or reduce operational costs to improve its very low profit margin.

Monitor discount impact on profit regularly using dashboards and adjust promotional strategies accordingly.

Conclusion

While the business generates strong overall sales of R2.29M, profitability is highly sensitive to discount levels. Technology performs best in both revenue and profit, while Furniture requires strategic improvement. Effective discount management — keeping levels within 0–20% — is essential to maintaining long-term profitability.
